

USGS Science for the 21st Century

Discussion on Science to Help Answer Serious Questions

Monday, September 14, 1 - 3 p.m. Central

Join USGS colleagues in an interactive session to discuss new USGS research efforts and emerging science initiatives. Share your input with us to help shape future research and the development of tools that address your needs.

We will present short lightning talks on select topics that exemplify our science direction and want you to help us enhance our understanding of the management context for our work. We look forward to learning about ways we can make stronger connections between USGS science and your science and management needs.

- Actionable Tools for Biosurveillance of Invasive Species and Wildlife Diseases
- Tying Together Water Management Decisions and Species Biology Science
- Accelerating Climate Adaptation Science
- Eye in the Sky: USGS Fire Resources for Fish and Wildlife Habitat

Who should attend: Science coordinators and fish and wildlife managers at state and federal agencies and NGOs, and anyone interested to engage and collaborate on ecological and conservation science!

What to expect and what to bring: This will be an interactive forum - we will leverage several tools to share information. Have audio, video, and computer available for the best experience possible.
